“

Introduction

- **AI-driven hyper personalization** tailors content, products, and services in real-time.
- Uses **AI, machine learning, and big data** to adapt to user preferences dynamically.
- Improves **engagement, satisfaction, and retention** by delivering relevant experiences.
- Businesses benefit from **higher conversions, customer loyalty, and optimized marketing.**

”

Problem Statement

Modern customers expect highly personalized experiences that cater to their unique preferences. In this hackathon, participants will develop a Generative AI-driven solution that enhances hyper-personalization by analyzing customer profiles, social media activity, purchase history, sentiment data, and demographic details. The challenge is to design a system that generates personalized recommendations for products, services, or content while also providing actionable insights for businesses to optimize customer engagement

Our Solution

Preferred products

- Suggesting financial products from our options based on user history
- Considering User information evaluate the best financial products

Gen AI integration

- Leveraging GenAI to understand customer requirements
- Helping customer to understand the recommended products

Tech Stack Used

- 
- 1.React js
 - 2.Flask
 - 3.TensorFlow, Keras,
XGBoost, Pandas, Kaggle

Model Description

Dataset

- We used two publicly available datasets for this project: (a) **Santander Product Recommendation** and (b) **Loan Approval Prediction**.
- The first dataset is **Santander Product Recommendation** ([link](#)). This dataset contains 1.5 years of customers behavior data from Santander bank to predict what new products customers will purchase. The dataset contains **23 products** which we've grouped into **7 product lines** to recommend.
- The second dataset is **Loan Approval Prediction** ([link](#)). This dataset relates to loan approval applications and is generated using data from a real-life financial institution.

Model Flow

Model

- We use **TensorFlow** and **Google Gemini** to build our model. We first use TensorFlow's **Keras** API to design a Deep Neural Network that utilizes the concept of **embeddings** to store a hypothetical profile for each user in the system, then using these **embeddings** and other collected information about the user to train the Neural Network to output recommendations.
- We then feed the output of the Neural Network into a genAI model to generate **reasoning** for the produced output, in order to create actionable insights.
- We used open-source GPUs on **Kaggle** to train our models.

DLTA Recommendation System

Customer ID:

Here's what we understand about you:

Based on the information we have gathered, the customer's primary financial goal is long-term investment for the future, with a preference for minimal risk. They are also looking to maintain a small emergency fund. They specifically seek investment options characterized by the lowest possible risk profile.

Reason for Preferred Products:

Based on the information we have gathered, we have suggested these products to you because of your goals and financial profile:

- **Investments:** Given the primary goal of long-term investment for the future with a preference for minimal risk, investment options are crucial. We would explore strategies to align with this need.
- **Short-Term Deposit:** Considering the desire for a small emergency fund, short-term deposits can provide a safe and accessible place to keep funds readily available for unforeseen expenses, complementing your investment strategy.
- **Loans:** While the initial assessment doesn't highlight a specific loan need, we've included the

Challenges & Future Scope

Personalized Recommendations

With having multiple options to pick from for customer, we can help customer in selection

Understands current needs of customer

Niche markets

Pursue scalable customer service through sustainable strategies

We can see the trends the market to change the suggestions us GENAI

Robust Scalable app

With using financial data trained LLM, we can get even robust explanations and suggestions.
